

CURRENT PLAN

MY CONCERN:

This is basically a where clause.
i.e. the where clause basically already
summarises what we would be displaying.

Also, we'd have to add a different colour for planned family events - fire, but like, a bit messy I guess.

THIS WAY:

- visualisations actually add value
- communal calendar is shared space becomes primarily for planning family-wide events, not adding everyone's individual availability all on top of each other
- respects privacy a bit more + updates existing workflow better
- logic driving the cameras & parsing should be almost identical, we'd just need 2 cams. & maybe 2 comps.

Love could hardcode the 3
other family members' for now
+ just have 1 degree of
freedom, for feasibility.
